

# Chopper Pumps on the right road

October, 2018

A Chopper Pump made by Landia is said to be playing an important role in a new effluent treatment plant for a leading Texas-based supplier of automotive lubricants.

Landia says serving an equalisation tank that contains a wide variety of plastic solids from the manufacturing and assembly process, its Chopper Pump has been chosen for its proven reliability, efficiency and longevity.

The company says designed with a system that prevents solids from entering the pump casing, the Landia Chopper Pump will run continuously, requiring only a basic annual service and in fact, the plant recently budgeted to replace an old mixer used in another holding tank with a Landia Chopper Pump due to positive results that have already been achieved.
